

## PIONEER OUR LAND PAVILLION TOMATO ENEMIES

Without the roots, stem, leaves and flower, a tomato could never grow. But there are bad critters that can easily destroy the plant. Read the descriptions of the bugs then look at the picture of a tomato plant. Print this page off and draw the bugs onto the part of the plant that they like to attack.

**Tomato Fruit Worm** – These pests mine leaves and bore into the fruit and its buds.  
**Hornworms** – These insects feed on leaves. After a while the leaves are striped from the vine

**Aphids** – These bugs suck sap and cause leaf discoloration or fruit deformation

**Blister Beetles** – This beetle makes holes in the leaves.

**Stink Bug** – Stink bugs pierce the buds and fruit. They cause the buds to die and the fruit to be discolored

**Cutworm** – This pest feeds on the roots and lower stems, which can make the plant die.
